                                                                                                                                                                                                                                                         Tunnour associated antique peptides (TAA) may be used for the treatment, prevention and cure of educer or cancer metastasses. The cancer may be breast, bladder, prostate, parotess, ovary, thyroid, colon, stomach, head or neck cancer or a carcinoma. The tunnous associated antiques are presentable to the immune system by HtA-A2 molecules and are qenerally between 8 to 10 amino acids in length. The amino acids in length antiques are the anchor residues which participate in the binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MRC class I molecules, more specifically HLA-A2. More tunnour associated anniques are described in GNBESD records AAV828B6-Y82B82. Those tunnour associated autipens described in records AAV82B66-Y8ZB42 and AAV82RF5 YY8ZH69 are derived from Groplakin, such as Uroplakin II, Uroplakin il and Uroplakin, such as Uroplakin II records AAV8ZB55-Y8ZB29 are derived from prostate specific antigen (PSA). Those described in records AAV8ZB35 are derived from from the control of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 prostate specific membrane antigen (PSMA). Those described in records YY82836-AAY82839 are derived from prostate acid phosphotase (PAP). Those described in records AAY82840-Y82846 are derived from Lactadherin (BA-46). Those described in records AAY82847-Y82854 are derived from Much and those described in records AAY82871-Y82864 are derived from Teratocarcinoma derived growth factor (CRIPTO-1).

Recombinant antigen can be extressed in probabilities of (11%-cs)lated) in cubalyctic cells.

Lactadherin protein was found in exceemes produced by dendritic cells. The protein is involved in the playertisis of particulate antiques by dendritic cells. Exceedes produced by dendritic cells capacity the common antiques increased in the mediation of an immune response. Lactadherin or variants of it may be used in the mediation of an immune response. Variants of lactadherin may be used for inhibition and/or simulation of the cross primity of antiques and stimulation of the playerytosis of antiques by dendritic cells, compositions derived from lactadherin can also be used to mention and immune, response, mere specifically a CTL (crucial Tipplayerte) response and also to produce CTLs specific for a selected antique. The present sequence is the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chimeric isolated (haman) lactadherin polypoptide that functions as an adaptor of cross-priming to eliminate pathogenic antiqens, e.g. in

(1) is useful in gene therapy techniques to restore memory activity ( (11) or to treat disease states in defini
                                                                                                                                                                                                                                                                                                                                                                                                                               quantifating a polypeptide in tissue, as molecular weight markers and as a food supplement. (I) and its binding pathers are aserui in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in traditional expression of binding about the polymerical expression of binding activity. The polypeptide and polymerical sequences have applications in diagnostics, forensies, gene mapping, identification of metalicus responsible for genetic disorders or other traits to assess binding-its it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diagnostic amino acid sequences of the invention.
Note: The sequence data for this patent did not appear in the printed
specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                      to restore [nerin_d] axivity ( (11) or to treat discuss states incolving (11) . (11) is useful for generating antibodies against it, detecting or
                                                                                                                                                                                                                                                             The invertion is lates to isolated polymacheotide (i) and polypeptide (ii) sequences. (I) is eastful as hybridisation probes, polymerase chain reaction (PCR) primers, olipomers, and for chromosome and gene mapping, and in recombinant production of (ii). The

The invention relates to isolated polynucleotide (1) and polynectide (1) sequences. (1) is useful as hybridisation probes, polynectide (1) sequences. (1) is useful as hybridisation probes.

Delynectide thain reaction (EEE) primers, cliquents, and tear characteristic dark quantities are also used in diagnostics as expressed sequence tags. Or identifying expressed areases. (1) is useful in quentificates in the continuous to restore normal activity of (1) or to treat dark prepetide in tissue, as molecular weight marities involving quantitating a polypeptide in tissue, as molecular are useful in medical imaging of sites expression (11). (1) and (11) are useful in medical imaging of sites expressing (11). (1) and (11) are useful in medical imaging of sites expressing (11). (1) and (11) are useful in medical disorders involving aberrant protein expression or biological activity. The perpetride and polymerication identification of matations in disquestics and activity sequences have applications in disquestic animal trapers of data and products dependent on DNA and animal textures. Additional Actual and products dependent on DNA and animal actual asserts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human brain expressed single exon probe encoded protein SEG ID NO: 37670.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: the sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from NIPO at Itp.wipo.int/pub/pubished_pct_sequences.

                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                  The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may emable diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schlzophrenia, epilopsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; immunosuppressive; nontropic; neuroprotective; antiviral; autialleraic; hepatotropic; antidiabetic; antiinflammatory; antiloter; vuluerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant, qene therapy, cancer; immuno disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein.

```
(a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal aland, bone marrow, breast, astrochisestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's discase, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis;
                              in the descriptor line. The sequence is a search result true a BLASTX homology search. The genes and proteins are useful for preventing, analytical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human fissues disclosed
                                                                                                                                                                             in the specification. The mucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of:
                                                                                                                                                                                                                                                                                                                                                                                                  diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardicvascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolating a nucleotide which encodes the zeytor 10 cytokine receptor enables the production of recombinant cells expressing the receptor. Those cells can then be used to detect the presence of modulater of asytorium by cultaring the cells in the presence of a test ligand and comparing levels of activity of mouse acytorium.
peptide fragment homologous to the protein encoded by the year given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New cytokine receptor mouse zeytor 10, useful for detecting ligands

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid majorule encoding a human cytokine receptor common gamma chaim like polypoptide, useful for treating, precenting and/or diagnosis) e.g. tuacis, inflaamatory diseases and immunodeficiency
in the presence and absence of the test sumple. Similarly, detection of swaterly receptor lighted within a test shaste can be achieved
         The method comprising contacting a test sample can be indicated. The method comprising contacting a test sample containing an amino acid sequence for 78:5 1977 to Files of the Polypeptide to eytokine receptor and detecting the binding of the polypeptide to a ligand in the sample specified peptide transments of the zeroz in eytokine receptor and the methods described are used to identify
                                                                                                                      ligands that stimulate the proliferation and/or development of haematopoictic. Lymphoid and myeloid cells. Peptide transments of the cytokine teceptor are useful for treating lymphoid, immune, inflammatory, sphenes, klood or bone disoiders and for generating antibodies directed against the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a human cytokine receptor common quama chain like protein (GRGGL). The invention is useful for treating, perventing and/or disposing conditions such as tumours, inferions, inflammatory disposes, immune disorders, neutraboreative disposes.

The present sequence represents human milk fat globule protein MFG-EB, which has barriegy to the decelegratially regulated cadethelial cellicus; i (bel i). The feil protein has epidenmal growth factor (555) like domains and discoldin lifeator villilise domains. The bell proteins have an inhibitory effect on angiogenesis (blood vessel growth), this activity may be useful chindrally to prevent neovascularisation of tissues such as tumour nodules and prevention of metastases. The anti-angiogenesis activity of 50-1 may be used to treat absorbing conditions that result from angiogenesis, including cancer, diabetic retinopathy, then memoring after the angiogenesis in the post including cancer, diabetic retinopathy, angiogenesis in the post in the decides and result in the factor of the promotes. Since the promotes stroke, who as it can be asked to the decided its binds to alpha V beta 3 userual for promoteing bone formation. Del-1 binds to alpha V beta 3

```

RESULT 15

```
receptor enables the production of recombinant cells expressing the receptor. Those cells can then be used to detect the presence of a modulator of zeytor10 protein by culturing the cells in the presence of a test ligand and comparing levels of activity of mouse zeytor10 in the presence of the test sample. Similarly, detection of zeytor10 receptor ligand within a test sample can be achieved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The most hod comprising contacting a test sample containing an amino acid sequence from cys15 or 61/25. Its froats of the acytor 10 or cytokine receptor and detecting the binding of the polypeptide to a ligand in the sample. Specified peptide fragments of the acytor 10 acytokine receptor and the methods described are used to identify ligands that atimulate the proliferation and/or development of haematopoietic, Immphoid and myeloid cells. Peptide fragments of the cytokine receptor are useful to for treating lymphoid, immune, inflammatory, splenic, blood or hone disorders and for generating antibodies directed against the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New cytokine receptor mouse zcytor 10, useful for detecting ligands

- SUBCELLULAR LOCATION: Type I membrane protein.
-1- SIMILARITY: BELLONGS TO THE CYPOXINE FAMILY OF RECEPTORS.
-1- SIMILARITY: CONTAINS I FIBEONECTIN TYPE III-LIKE DOMAIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Schaffner C., Laach H., Hagemann R.;
"Detection of point mutations in chloroplast genes of Antirrhinum majus. L. I. Identification of a point mutation in the psaB gene of a photosystem I plastone mutant.";
Mol. Gen. Genet. 249:533-544(1995).

'! FUNCTION. FsaA and psaB bind P700, the primary electron donor of photosystem I (PS1), as well as the electron acceptors A0, A1, and FX. PSI functions as a plastocyanin/cytochrome c6-terredoxin oxidoreductase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Copportion P000 is a chlorophyll A dimer, A0 is chlorophyll A, A1 is a phylloquinone and FX is a 4Fe-4S iron-sulfur center.
